

wraps your house in warmth

RESPONSE TO THE RECENT ARTICLES ON WOODBURNERS AND AIR POLLUTION

Providing your stove within the home is installed and maintained correctly - the exhaust system connected (flue pipe) will extract all of the products within the combustion chamber. (Flues and internal baffles must be cleaned according to the appliance manufacturers instructions). Appliances on sale now and from 1.1.2022 must conform to the Eco design statement for clean burning wood fired appliances.

Currently wood burning stoves contribute to less PM 2.5 (the most harmful particulate matter) than road transport and half of that produced by industry.

Don't forget: PM 2.5 matter in the atmosphere has fallen by 78% since mid 1970's. Contributing factors are road traffic; Industry (50%) and all types of home burning; bonfires; BBQ's and fire pits.
